

# Driveway Spacing

## Why is Driveway Spacing Important?

Motorists turn left and right in and out of driveways when permitted. Traffic turning into and out of driveways moves more slowly than through traffic. This speed difference produces conflicts that may lead to broadside and rear-end collisions between vehicles. Traffic safety research commissioned by the Minnesota Department of Transportation shows that roadways with a large number of closely spaced driveways are *always* less safe than similar roads where driveway access is more limited. For example, an urban route with 100 feet between driveways should experience roughly twice as many accidents as a similar route with 250 feet between driveways.

## What is a Reasonable Distance between Commercial Driveways?

Spacing requirements may be based, among other factors, on posted speed limits, the classification of the roadway, or the amount of traffic generated by a development. Spacing requirements should reflect a balance between traffic and engineering conditions and needs, local development objectives, and existing land-use characteristics (such as lot sizes, land-use type, and frontage requirements). There are no hard and fast guidelines for driveway spacing; however, the table below used in Florida and Ohio is indicative of good practice. As the posted speed limit rises, the recommended spacing between driveways increases:

Posted Speed on Arterial Street (mph)	Centerline to Centerline Driveway Spacing (feet)	Approx. Number of Driveways per 500-Foot Block Face
20	85	About 6
25	105	5
30	125	4
35	150	3
40	185	3
45	230	2
50	275	Fewer than 2

Source: City of Tallahassee, Florida, and OKI Regional Government, Cincinnati, Ohio.

These driveway spacing guidelines are based on the minimum distance needed to reduce collision potential due to overlapping right turns. Since urban and suburban arterials typically are designed to operate at 35 to 45 miles per hour, the desirable minimum driveway spacing will be approximately 150 to 230 feet, allowing for only 2 to 3 driveways per block face. When this range of spacing is not achieved, the result will be a higher accident rate.

**What is a Reasonable Distance between Commercial Driveways in Rural Areas?**

In rural areas, the posted speed is usually at or above 55 miles per hour. The higher speeds mean that driveway spacing in rural areas must be greater to provide for a safer traveling environment. On state highways, spacing is also longer because the routes are primarily designed to carry through traffic rather than to access property. Most states use a hierarchy to apply a driveway spacing standard. The more important a route is to through traffic and commerce, the longer the spacing between driveways. The following table shows Kansas’s standards for its highway system:

<b>State Highway Route Type</b>	<b>Min. Spacing between Driveways (feet)</b>	<b>Approx. Number of Driveways per Mile</b>
Major Arterial (National Highway System road)	2,640	2
Other major arterial (not part of NHS)	1,320	4
Minor arterial	660	8
Other roadway (collector, etc.)	500	10
